KOBA Vision was founded in 1988 by the visually impaired electronics engineer Johan Haagdorens. His search for a reading device with a large screen was the motive for him developing video magnifiers himself.

The result was a high quality video magnifier that specifically met the requirements of visually impaired people.

Today KOBA Vision is known as the world's most innovative producer.

The patented Vocatex readout magnifier, high definition cameras, large displays and the simplest EasyReader readout system for blind people are only a few examples where KOBA Vision is a pioneer in the sector.
